Abstract

This is a proposal for a hospital appointment system We plan on making an application for Android (Flutter) for the patients' side and a web-app for the hospitals where the appointments can be managed. In this document we outline what our approach is, what technologies we will use when implementing the system, what are the potentials risks involved, etc. Our system aimsto replace the traditional phone-based systems for appointment booking that is slow & prone to error.

1. Introduction

1.1 About Domain/Area

One of the major challenges existing hospital management systems faces is around operational efficiency and waiting time between different departments and patients.

Nowadays the major problem is that, there is no such type of facilities which provide to the patients to book appointment with the doctor in very urgent medical situations, rather the patient has to wait for the appointment of the doctor. While it gets too late till the doctor provides proper treatment to the patient.

1.2 Objective

Our mobile application that will make it easy for laypeople to book an appointment at hospitals. Our simple system that makes use of modern technologies and take advantage of the ubiquity of smart phones in today's world to make the process of booking an appointment at thehospital an easy and seamless process. This will greatly reduce the amount of work required by humans to coordinate and manage appointments. It will increase efficiency, accuracy and provide greater control over the information to both the hospitals and patients.

1.3 Users

- Patients
- Doctor
- Lab Assistance

1.4 Module and Functionality

1. We are creating an Android Flutter application for patient which they can use to Book an appointment.

2. We are creating a web application at hospital side using Flutter which will help hospital staff to manage all appointments

2. Literature Survey

2.1 Existing System

One of the major challenges existing hospital management systems faces is around operational efficiency and waiting time between different departments and patients. Nowadays the major problem is that, there is no such type of facilities which provide to the patients to book appointment with the doctor in very urgent medical situations, rather the patient has to wait for the appointment of the doctor. While it gets too late till the doctor provides proper treatment to the patient. We will build an application which provide all the facilities such as, online appointment for all the available doctors at any time. clients can also view doctor's profile and can also give feedback to the hospital and also view the previous feedback given by the other patients. The patients can also directly pay for the appointment via any payment gateway. They can view and download their reports which will also send to the doctor so that doctor can analysis the report for better treatment. This will make patient's life efficient and secure and also ensure that they get the best service at their fingertips. Ultimately these facilities will help for the betterment of patient's health.

2.2 Working of the current system

- practo app is used for online consultation to doctor
- Mfine having only 375 doctors and mfine connects the person with the doctor within a period of 30-40 minutes after appointment
- TATA health is providing 24*7 online consultation and also provide chats to doctor
- Docon The app lets the person consult a doctor through video call. Prescription is also given digitally and your medical history too is maintained on the app

2.3 Problem Summary

This is a project for a hospital appointment system. We plan on making an application (Android (Flutter)) for the patients' side and a webapp for the hospitals where the appointments can be managed.

3. Detailed Design.

3.1 Functional Requirements

There are a lot of software requirements specifications included in the functional requirements of which contains various process, namely Registration, Check out, Report Generation, and Database.

- ***Registration Process***
  - Adding Patients: The Hospital Management enables the staff in the front desk to include new patients to the system.

- ***Check Out:***
  - Deleting Patient ID: The staff in the administration section of the ward can delete the patient ID from the system when the patient's checkout from the hospital.

- ***Report Generation:***
  - Information of the Patient: The Hospital Management System generates a report on every patient regarding various information like patient's name, Phone number, bed number, the doctor's name whom its assigns, ward name, and more.

- ***Database:***
  - Mandatory Patient Information: Every patient has some necessary data like phone number, their first and last name, personal health number, postal code, country, address, city, 'patient's ID number, etc.
  - Updating information of the Patient: The hospital management system enables users to update the information of the patient as described in the mandatory information included.

## 3.2 Tools and Technologies

We are targeting three platforms:

• Web

• Android

We chose these three platforms because they cover 99.99% of the use-cases of our app.

For designing and implementing the project the following technologies were used:

1. Flutter: Flutter is an open-source UI software development kit created by Google. It is used to develop cross platform applications for Android, iOS, Linux, mac OS, Windows, Google Fuchsia, and the web from a single codebase.

2. Firebase: Firebase is a platform developed by Google for creating mobile and web applications and this is efficient with flutter application

5. Conclusion and Future work

5.1 Conclusion

Our mobile application that will make it easy for lay people to book an appointment at hospitals. Our simple system that makes use of modern technologies and take advantage of the ubiquity of smart phones in today's world tomake the process of booking an appointment at the hospital an easy and seamless process. This will greatly reduce the amount of work required by humans to coordinate and manage appointments. It will increase efficiency, accuracy and provide greater control over the information to both the hospitals and patients.

5.2 Future Work

1. Video Conferencing integration
2. Patient messaging to Hospital
3. Calendar Sync

6.1.1 AEIOU Canvas

AEIOU Summary :

Group ID: 389842   Date : 28.09.22   Version :

Domain Name : APOINTMENT SYSTEM   OPD

Environment:

- Rainy

Interactions :

- Traffic

- Signal

Objects :

- Computer

- Mobile Phone

Activities :

— Online appointment for all the available doctors at any time.

— Clients Can also view doctor's Profile.

— Clients Can give feedback to the hospital.

— Clients view the Previous feedback given by the other patients.

— The patients Can also directly pay for the appointment via any payment gateWay.

— They Can view and download their reports which will also send to the doctor.

Users :

- Consultant

- Doctor

- Receptionist

- lab Administrator

6.3.1 Mind Mapping

Mind Mapping Canvas

Group ID 389842

Date 28.09.22 Version

Domain Name OPD APOINTMENT SYSTEM

ONLINE OPD APOINTMENT APP

We will build an application which Provide all the facilities such as, online appointment for all the available doctors at any time. clients can also view doctor's profile and can also give feedback to the hospital and also give & view the Previous feedback given by the other Patients.

The Patients can also directly Pay for the appointment via any Payment gateway. They can view and download their reports which will also send to the doctor. so that doctor can analysis the reports for better treatment. This will make patient's life efficient and secure and also ensure that they get the best service at their fingerprints. Ultimetely these facilities will help for the betterment of patient's health.

A. Users — Doctor, Receptionist, Lab Administrator

B. Objectives — Manage Details, Reduce manual Works, better and flowless management

C. Benifits — Better time management, Centralize information

D. Purpose — 24/7 available, Provide convenience to Patients, Book appointment instantly, Better and flowless hospital management System

E. Functionality — Online appointment for available doctor, User Feedback, User manage all activities regarging hospital

6.4.1 Ideation Canvas
6.5.1 Product Development Canvas

Product Development Canvas

GROUP ID: 389842 Date: 13.10.22
Design For: OPD APOINTMENT SYSTEM

? Purpose

What is the purpose of this concept you're developing? Dose it solve a problem, or it enhances a certain experiences?

Is it serving a need or it is trying to creat a new need or tap an untapped need?

- To Provide Convenience to Patients.
- Book Appointment Instantly
- For Better and Flawless hospital management System.

⚓ Product Experience

Define what your customer should feel like when he uses your product / service ? emotions, feelings would define his experience ? feeling Convenience, or feeling of buying more with less (cost conscious) or feeling of greater security, safety etc.

- Easy to use.
- Provide better Convenieng

✖ Product Functions

Functions are a products answer to user problems / need. They do something that user wants. They are often verbs in nature, Every function is powered by many features, Multitasking is a function. Browser tabs is a feature that powers the multitasking feature. A function can have one or more features powering it. Functions are very generic in nature, features are often more specific. Functions can be similar to product experience. Safety (product function) provides a feeling of safety (product experience)

- Online appointment for all the available doctors at any time.
- Clients can also view doctor's Profile.
- They can View and download their reports which will also send to the doctor.

⊕ Product Features

Product feature are specific. One of more features will power a function. Antilock Brakes, Airbags are feature that power the safety function. Browser tabs, Apple's home button to multitask between apps are features powering the multitasking function. Each feature will have many components/sub components powering it. Sometimes a very popular component becomes a feature in itself. Like car stereo is a major components and a feature at the sametime powering the in car entertainment function powering entertrainment as a product experience.

- Better time management
- Better track record call documents. (i.e. Repeats, Files)
- Maintain data Pairvacy

⚙ Components

Components build up the features. For a airbag it will comprise a list of component like bags, triggers etc. that go into making it. For a tabbed browser it will comprise of various chunks of code that will make the tabs work. In cases where the feature is a major component, you could list here the auxiliary components that are required to make the major component work. You can also list new adjustments and innovations you're planning here at the component level.

- Mobile phone.
- Computer/Laptop.

☑ Customer Revalidation

Once you're finished with your feature set, test with the customer / user if the features, functions are useful, Speak to the customer / user.

- Add new Feature to Communicate with doctor's and hospital.
- Treatment time is very Fast.

⚗ Reject, Redesign, Retain

Post customer validation, reject, those function or feature that the customers didn't find useful, Redesign those that were partially useful and retain those that met the bar, iterate with this until all functions / features are accepted.

- Redesign

👥 People

Who is the key customer segment who will use this product /service or the end product of the concept you're pusuing?

Write here about them, describe them a little.

- Consultant
- Doctor
- Receptionist
- Lab Administrator
